PART 1: INTRODUCTION

In this project, we developed a fast food website with two separate access; user and admin. Our user page contains the Home page, Menu page, the About us page, a Contact page with a form, a Rating page about services and products with Comments form, Registration, Login and Dashboard.

Firstly the user will see the home page, and from there, the user can go to the Registration page for registering by clicking the button right side of the page "Login/Registration". When the new customer register, the information is saved in the MySQL database and the alert box will show, "(The username of the customer) is successfully registered". And the returning customer can log in directly by clicking the login option providing their Email and password. After the user login, our website will take them to the dashboard. From there, they can see the orders, account details, logout, and can rate services. Users can access the menu page, can order and also rate the products. Moreover they can see the members of this company in About Us page. Next in the contact page they can contact us filling the form provided.

Besides that, the admin will need to login through the login page before entering the website. After they login, they can see the admin dashboard and the buttons for accessing the Staff, Member, Product/Category, Order and Sales report directly. Admin able to manage staff page, member page, product category page, product page, manage order page and sales view report page after access the website on dashboard. Admin able to add, view, delete and update for the staff, member, product category, product, and order. With the manage staff page, admin is able to add a new staff or update staff new information to the database or even delete a staff. Moreover, they could view the staff list with the view staff page. Furthermore, they can also add a new member to the database with the add member page. Admin could help to change the member information through the edit member page and delete for a member with delete member page. The details information for members are able to view with the view member page. Next in product and category page, admin can view/delete/update and add any products or categories of that product. For product page admin can fill the Product id, name, stock, price and category to add. Also can update any information from this which will be saved in database. For deleting any product admin need to type the product id that she want to delete. In the view part admin can view the history from the databases on her page. Also for category, admin need to provide category id and name to add. And same like product for deleting any category she need to provide the particular category id. For update admin need to input category id and can update category name. Lastly for viewing admin can generate the list by clicking the button.

Lastly the sales report where it will display the product name, ID, stock and also the prices for the product.

To sum up, in our website User page have home, menu, about us, contact, login, logout, dashboard and rating forms. On the other hand for dashboard

we have staff page, member page, product category page, product page, manage order page sales report where admin can add,view,update and delete.
